

Investigating Deep Neural Networks (DNNs) Through Learning Rule-Specific Representational Profiles

By: Bati Yilmaz, Omid Amiratashani, Chengcheng Du, Ghanendra Singh

Pod name: Appreciative Nemesis

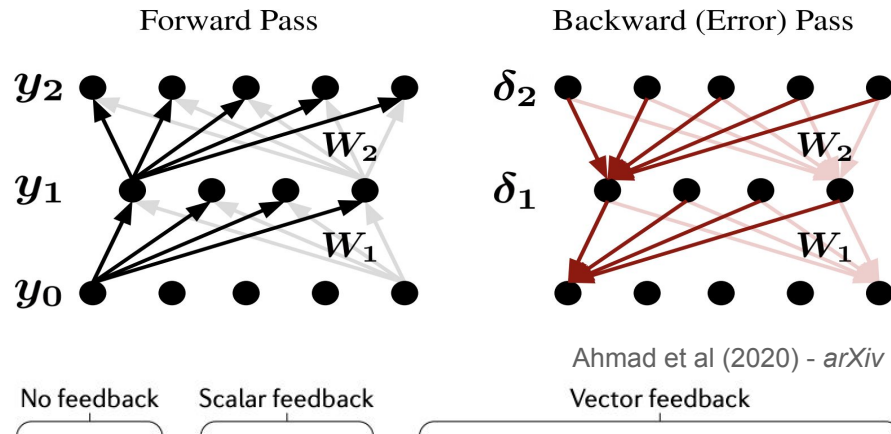

Group name: μ Represent

Introduction

Cichy and Kaiser (2019) - *Trends Cogn Sci*

Ahmad et al (2020) - *arXiv*

Feedforward network
Output

Input

Hebbian learning

Perturbation learning

Backpropagation

Backprop-like learning with feedback network

Lillicrap et al (2020) - *Nat Rev Neurosci*

Main Question

How and to what extent

DNNs having the same architecture, trained on the same dataset but using different learning rules exhibit unique representational profiles?

Side Quest

Specifically, the comparison of an artificial and a bio-plausible learning rule:
Backpropagation (BP) and Feedback Alignment (FA), respectively.

Methodology

Utilized Pytorch and BioTorch (Sanfiz and Akrouit, 2021) library to implement FA.

We used the same parameters:

- Cross Entropy Loss
- Adam Optimizer
- Learning Rate 0.0001
- 100 epochs

We Used CIFAR-10 dataset.

Results

Losses across
(FA vs BP)

Results

RDMs BP

Trained BP

Accuracy

72.31%

Random BP

RDMs across layers for Trained Backpropagation Model with Standard Images

RDMs across layers for Random Backpropagation Model with Standard Images

RDM: Representational Dissimilarity Matrix

Results

RDMs across layers for Trained Feedback Alignment Model with Standard Images

RDMs FA

Trained FA

Accuracy

62.86%

RDMs across layers for Random Feedback Alignment Model with Standard Images

Random FA

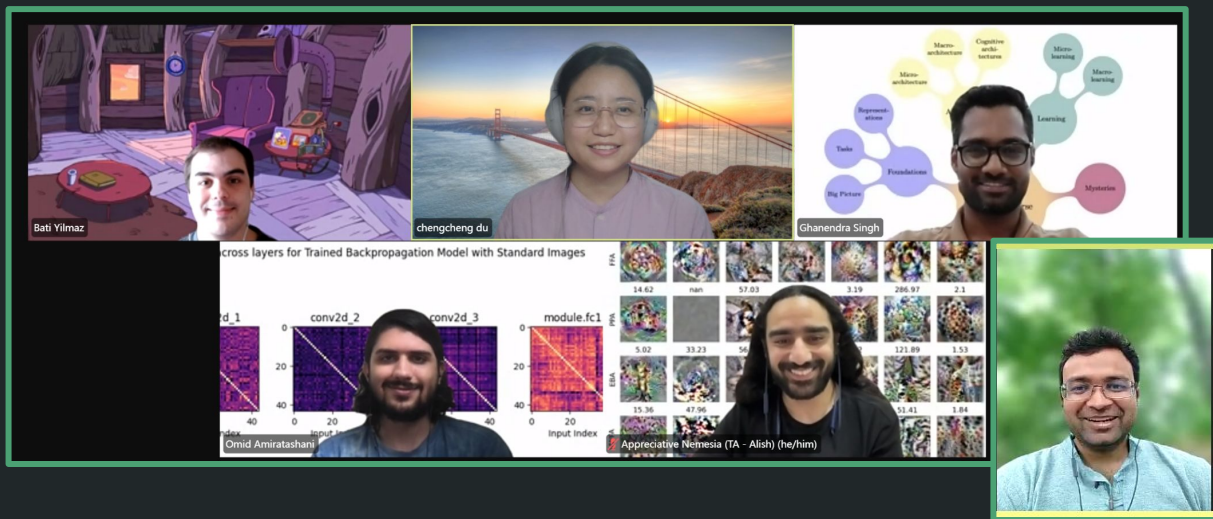

RDM: Representational Dissimilarity Matrix

Conclusion / Discussion

1. **Representations** of the same category of clean images appear remarkably similar in **deeper layers**, exhibiting a block diagonal structure, while **earlier layers** captures more **general** and granular visual features in DNN.
2. **Backpropagation** achieves higher accuracy than feedback alignment as it uses **precise gradient information** to update weights, ensuring more effective and optimal learning of the network parameters.
3. **Feedback alignment** shows competitive performance on **simpler tasks** but falls behind with more complex ones like CIFAR-10, which are crucial for understanding (biologically plausible) learning processes in human brain with insights from neuroscience. (Kolen and Pollack, 1994; Lillicrap et al., 2016; Sanfiz and Akrouit, 2021)

Aakash Agrawal

Thank you for your attention!

And a special thanks to our TA, Alish Dipani, our project TA, Aakash Agrawal!

Also the Kolen-Pollack algorithm (Kolen and Pollack, 1994), which proposed a very similar bio-plausible learning rule idea before.

General Discussion / Q&A

Do you have any questions or remarks?
